Homework 3

October 25, 2016

Francine Leech, Reffat Manzur, Chen Xiang

Problem B1 (20 pts).

Let us prove this first for two subspaces. $E = U_1 \oplus U_2$ if and only if

$$(1)\ E = U_1 + U_2$$

and

$$(2)\ U_1 \cap U_2 = 0$$

.

For (1), every vector $e \in E$ can be uniquely written as $e = u_{11} + u_{21}$ with $u_{11} \in U_1$ and $u_{21} \in U_2$.

For (2), let $e \in U_1 \cap U_2$. Since $e \in U_1$ and $e \in U_2$, then we can write,

(1) $e = e + 0$ where $e \in U_1$ and $0 \in U_2$ and

(2) $e = 0 + 0$ where $0 \in U_1$ and $e \in U_2$.

But $e = u_{11} + u_{21}$ is unique, so $e = 0$. Since $E = U_1 + U_P$, we will check uniqueness. Suppose $e = u_{11} + u_{21}$ and $e = u_{12} + u_{22}$ where $u_{11}, u_{12} \in U_1$ and $u_{21}, u_{22} \in U_2$. Then $u_{11} + u_{21} = u_{12} + u22$, so $u_{11} - u_{12} = u_{22} - u_{21}$. Let x be a vector such that $x = u_{11} - u_{12} = u_{22} - u_{21}$. Then $x \in U_1$ and $x \in U_2$, and $u_{11} = u_{12}$ and $u_{22} = u_{21}$, so $x \in U_1 \cap U_2 = (0)$.

Now by induction we can extend our logic for any number of $p \geq 2$ subspaces of some vector space E.

Problem B2 (50 pts).

(1)

By definition an involution is a function f that is its own inverse.

$f: E \to E$ is in an involution when $\forall x \in E: f(f(x)) = x$. Since $f^{-1} = f$, we just have to check that $f(f(x)) = x$ for all x in the domain of f.

Let us find the inverse of $f(x) = b - x$ where b is any real number. Let,

$$f(x) = a - x$$

$$y = a - x$$

$$f^{-1} = a - y$$

$$x = a - y$$

$$y = a - x$$

so $f(x) = f^{-1}(x)$. So it's an inverse of itself.

(2)

Let $u_1 = \frac{u+f(u)}{2}$ and $u_{-1} = \frac{u-f(u)}{2}$.

Next, we can find that we have something in both the spaces. $f(u_1) = f(\frac{u+f(u)}{2}) = \frac{f(u)+f(f(u))}{2} = \frac{f(u)+u}{2} = u_1$
$f(u_{-1}) = f(\frac{u-f(u)}{2}) = \frac{f(u)-f(f(u))}{2} = \frac{f(u)-u}{2} = u_{-1}$.

Next we need to look at uniqueness. Let $v_1 \in E_1 and \in E_{-1}$.
$f(v_1) = v_1$
$f(v_1) = -v_1$
$v_1 = -v_1$ can only have this if $v_1 = -v_1 = 0$.

(3) Let the basis of E be $(\xi_i), i = 1, 2, \cdots, n$, where $\xi_i = \begin{pmatrix} 0 \\ 0 \\ \vdots \\ 1_i \\ 0 \\ \vdots \\ 0 \end{pmatrix}$.Define

$f(\xi_i) = \begin{cases} \xi_i \; i = 1, 2, \cdots, k \\ -\xi_i \; i = k+1, k+2, \cdots, n \end{cases}$. Then $\forall u \in E$, we can write as $u = \sum_i \lambda_i \xi_i$ and

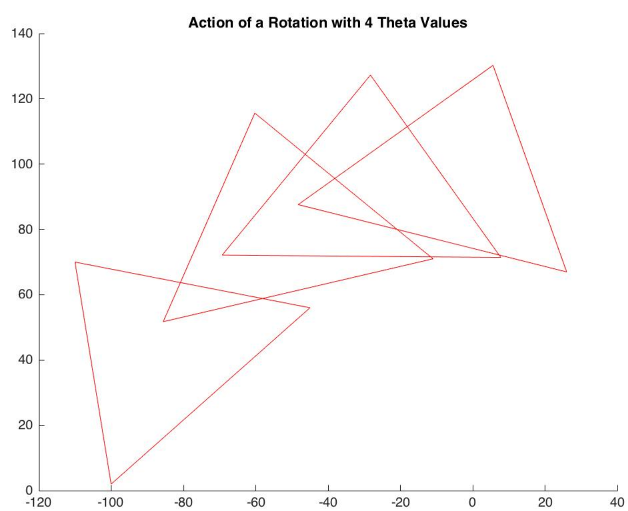
$$f(u) = \begin{pmatrix} \xi_1 \\ \xi_2 \\ \vdots \\ \xi_k \\ -\xi_{k+1} \\ -\xi_{k+2} \\ \vdots \\ -\xi_n \end{pmatrix} = I_{k,n-k} \cdot u.$$ And $(f \circ f)(u) = I_{k,n-k} I_{k,n-k} I_{k,n-k} u = Iu = u$. Thus f is an involution.

Geometric interpretation of the action of f is that $f(u)$ is the reflection of u in some axises. When $k = n-1$, we can easily find that $f(u)$ differs from u only in the last entry $f(u)_i = -u_i$, so it is the reflection across the n^{th} axis.

Problem B3 (50 pts). A *rotation* R_θ in the plane $\mathbb{R}^2$ is given by the matrix

$$R_\theta = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}.$$

(1) Use `Matlab` to show the action of a rotation R_θ on a simple figure such as a triangle or a rectangle, for various values of θ, including $\theta = \pi/6, \pi/4, \pi/3, \pi/2$.



(2) Prove that R_θ is invertible and that its inverse is $R_{-\theta}$.

$$\begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix} \cdot \begin{pmatrix} \cos(-\theta) & -\sin(-\theta) \\ \sin(-\theta) & \cos(-\theta) \end{pmatrix}$$

$$= \begin{pmatrix} \cos(1) & -\sin(1) \\ \sin(1) & \cos(1) \end{pmatrix} \cdot \begin{pmatrix} \cos(-1) & -\sin(-1) \\ \sin(-1) & \cos(-1) \end{pmatrix}$$

$$= \begin{pmatrix} (\cos\theta \cdot \cos(-\theta)) \cdot (-\sin\theta \sin(-\theta)) & -\cos(\theta)0 \\ \sin(\theta) cos(-\theta) + cos\theta \sin(-\theta) & 1\cos(1) \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

(3) Because $\cos(\alpha+\beta) = \cos\alpha\cos\beta - \sin\alpha\sin\beta, \sin(\alpha+\beta) = \sin\alpha\cos\beta + \cos\alpha\sin\beta$, we have

$$\begin{aligned} R_\alpha \circ R_\beta &= \begin{pmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{pmatrix} \cdot \begin{pmatrix} \cos\beta & -\sin\beta \\ \sin\beta & \cos\beta \end{pmatrix} \\ &= R_\beta \circ R_\alpha = R_{\alpha+\beta} \end{aligned}$$

We can get

$$\begin{aligned} &1.(R_\alpha \circ R_\beta) \circ R_\gamma = R_{\alpha+\beta+\gamma} = R_\alpha \circ (R_\beta \circ R_\gamma) \\ &2.R_\alpha \circ I = I \circ R_\alpha = R_\alpha \\ &3.R_\alpha \circ R_{-\alpha} = I \\ &4.R_\alpha \circ R_\beta = R_{\alpha+\beta} = R_\beta \circ R_\alpha \end{aligned}$$

So rotations in the plane form a commutative group.

Problem B4 (110 pts). Consider the affine map $R_{\theta,(a_1,a_2)}$ in $\mathbb{R}^2$ given by

$$\begin{pmatrix} y_1 \\ y_2 \end{pmatrix} = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} + \begin{pmatrix} a_1 \\ a_2 \end{pmatrix}.$$

(1) Prove that if $\theta \neq k2\pi$, with $k \in \mathbb{Z}$, then $R_{\theta,(a_1,a_2)}$ has a unique fixed point (c_1, c_2), that is, there is a unique point (c_1, c_2) such that

$$\begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = R_{\theta,(a_1,a_2)} \begin{pmatrix} c_1 \\ c_2 \end{pmatrix},$$

and this fixed point is given by

$$\begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = \frac{1}{2\sin(\theta/2)} \begin{pmatrix} \cos(\pi/2 - \theta/2) & -\sin(\pi/2 - \theta/2) \\ \sin(\pi/2 - \theta/2) & \cos(\pi/2 - \theta/2) \end{pmatrix} \begin{pmatrix} a_1 \\ a_2 \end{pmatrix}.$$

(1)We can write $\begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = R_{\theta,(a_1,a_2)} \begin{pmatrix} c_1 \\ c_2 \end{pmatrix}$ as:

$$\begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = \begin{pmatrix} cos\theta & -sin\theta \\ sin\theta & cos\theta \end{pmatrix} \begin{pmatrix} c_1 \\ c_2 \end{pmatrix} + \begin{pmatrix} a_1 \\ a_2 \end{pmatrix}$$

Then,

$$c_1 = cos\theta c_1 - sin\theta c_2 + a_1 \tag{1}$$

$$c_2 = sin\theta c_1 + cos\theta c_2 + a_2 \tag{2}$$

Using the result for (c_1, c_2) as given in the problem and by substituting, we will check if the equations are true for when $\theta \neq k2\pi$.

For c_1, we are given that

$$c_1 = \frac{1}{2sin\frac{\theta}{2}}(cos(\frac{\pi - \theta}{2})a_1) - sin(\frac{\pi - \theta}{2})a_2)$$

$\frac{1}{2}\frac{cos(\frac{\pi-\theta}{2})}{sin\frac{\theta}{2}}$ simplifies to $\frac{1}{2}$.
$\frac{-1}{2}\frac{sin(\frac{\pi-\theta}{2})}{sin\frac{\theta}{2}}$ simplifies to $\frac{1}{2}cot\frac{\theta}{2}$.
so:

$$c_1 = \frac{1}{2}(a_1 - cot\frac{\theta}{2}a_2)$$

Similarly, for c_2, it becomes

$$c_2 = \frac{1}{2}cot\frac{\theta}{2}a_1 + \frac{1}{2}a_2$$

Now by substitution into equation (1), we get :

$$\frac{1}{2}(a_1 - cot\frac{\theta}{2}a_2)$$

$$= cos\theta(\frac{1}{2}(a_1 - cot\frac{\theta}{2}a_2)) - sin\theta(\frac{1}{2}cot\frac{\theta}{2}a_1 + \frac{1}{2}a_2) + a_1$$

$$= (\frac{cos\theta}{2} - \frac{sin\theta}{2}cot\frac{\theta}{2} + 1)a_1 - \frac{1}{2}(cos\theta cot\frac{\theta}{2} + sin\theta)a_2$$

Then, $cos\theta - sin\theta cot\frac{\theta}{2} = -1$ and $cos\theta cot\frac{\theta}{2} + sin\theta = cot\frac{\theta}{2}$
so equation (1) on the right hand side simplifies to $c_1 = \frac{1}{2}(a_1 - cot\frac{\theta}{2}a_2)$ and matches the left hand side of equation (1).

For equation (2), we get:

$$\frac{1}{2}cot\frac{\theta}{2}a_1 + \frac{1}{2}a_2$$

$$= sin\theta\frac{1}{2}(a_1 - cot\frac{\theta}{2}a_2) + cos\theta(\frac{1}{2}cot\frac{\theta}{2}a_1 + \frac{1}{2}a_2) + a_2$$

$$= (\frac{sin\theta}{2} + (\frac{1}{2}cos\theta cot\frac{\theta}{2}))a_1 + ((\frac{-1}{2}sin\theta cot\frac{\theta}{2} + \frac{cos\theta}{2} + 1)a_2$$

Thus, the right hand side of equation (2) simplifies and $c_2 = \frac{1}{2}cot\frac{\theta}{2}a_1 + \frac{1}{2}a_2$.

It is then clear that the unique fixed point is (c_1, c_2) where $\theta \neq k2\pi$ because $cot\frac{\theta}{2}$ is undefined for where θ is a multiple of 2π.

(2) In this question, we still assume that $\theta \neq k2\pi$, with $k \in \mathbb{Z}$. By translating the coordinate system with origin $(0, 0)$ to the new coordinate system with origin (c_1, c_2), which

means that if (x_1, x_2) are the coordinates with respect to the standard origin $(0, 0)$ and if (x_1', x_2') are the coordinates with respect to the new origin (c_1, c_2), we have

$$
\begin{aligned}
x_1 &= x_1' + c_1 \\
x_2 &= x_2' + c_2
\end{aligned}
$$

and similarly for (y_1, y_2) and (y_1', y_2'), then show that

$$
\begin{pmatrix} y_1 \\ y_2 \end{pmatrix} = R_{\theta,(a_1,a_2)} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}
$$

becomes

$$
\begin{pmatrix} y_1' \\ y_2' \end{pmatrix} = R_\theta \begin{pmatrix} x_1' \\ x_2' \end{pmatrix}.
$$

Conclude that with respect to the new origin (c_1, c_2), the affine map $R_{\theta,(a_1,a_2)}$ becomes the rotation R_θ. We say that $R_{\theta,(a_1,a_2)}$ is a *rotation of center* (c_1, c_2).

(3) Use `Matlab` to show the action of the affine map $R_{\theta,(a_1,a_2)}$ on a simple figure such as a triangle or a rectangle, for $\theta = \pi/3$ and various values of (a_1, a_2). Display the center (c_1, c_2) of the rotation.

What kind of transformations correspond to $\theta = k2\pi$, with $k \in \mathbb{Z}$?

(4)

$R_{\theta,(a_1,a_2)}$

$$
\begin{pmatrix} y_1 \\ y_2 \\ 1 \end{pmatrix} = \begin{pmatrix} \cos\theta & -\sin\theta & a_1 \\ \sin\theta & \cos\theta & a_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ 1 \end{pmatrix}
$$

$R_{-\theta,(b_1,b_2)}$

$$
\begin{pmatrix} y_1 \\ y_2 \\ 1 \end{pmatrix} = \begin{pmatrix} \cos(-\theta) & -\sin(-\theta) & b_1 \\ \sin(-\theta) & \cos(-\theta) & b_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ 1 \end{pmatrix} = \begin{pmatrix} \cos(\theta) & \sin(\theta) & b_1 \\ -\sin(\theta) & \cos(\theta) & b_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ 1 \end{pmatrix}
$$

$$
R_{\theta,(a_1,a_2)} \cdot R_{-\theta,(b_1,b_2)} = \begin{pmatrix} \cos\theta & -\sin\theta & a_1 \\ \sin\theta & \cos\theta & a_2 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \cos(\theta) & \sin(\theta) & b_1 \\ -\sin(\theta) & \cos(\theta) & b_2 \\ 0 & 0 & 1 \end{pmatrix}
$$

$$
= \begin{pmatrix} \cos^2\theta + \sin^2\theta & cos\theta \sin\theta - cos\theta \sin\theta & \cos\theta b_1 - \sin\theta b_2 + a_1 \\ cos\theta \sin\theta - cos\theta \sin\theta & \sin^2\theta + \cos^2\theta & \sin\theta b_1 + \cos\theta b_2 + a_2 \\ 0 & 0 & 1 \end{pmatrix}
$$

$$= \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

So $\cos\theta b_1 - \sin\theta b_2 + a_1 = 0$ and $\sin\theta b_1 + \cos\theta b_2 + a_2 = 0$.

Solve for b_1,
$b_1 = \frac{-a_1 + \sin\theta b_2}{\cos\theta}$
$b_1 = \frac{-a_1}{\cos\theta} + \frac{\sin\theta b_2}{\cos\theta}$
$b_1 = -\sec\theta a_1 + \tan\theta b_2$

Solve for b_2,
$b_2 = \frac{-a_2 + \sin\theta b_1}{\cos\theta}$
$b_2 = \frac{-a_2}{\cos\theta} - \frac{\sin\theta b_1}{\cos\theta}$
$b_2 = \sec\theta a_2 - \tan\theta b_1$

Now plug in b_2 into b_1.
$b_1 = -\sec\theta a_1 + \tan\theta(\sec\theta a_2 - \tan\theta b_1)$
$b_1 = \sec\theta a_1 - \tan\theta\sec\theta a_2 - \tan^2\theta b_1$
$(1 - tan^2\theta)b_1 = \sec\theta a_1 - \tan\theta\sec\theta a_2$
$b_1 = \frac{-\tan\theta}{\sec\theta}a_2 - \cos\theta a_1$
$b_1 = -\sin\theta a_2 - \cos\theta a_1$
Now plug b_1 into b_2 we get, $b_2 = \sin\theta a_1 - \cos\theta a_1$.

The final answer for b_1 and b_2 in terms of θ, a_1, and a_2 is,

$$b_1 = -\sin\theta a_2 - \cos\theta a_1$$

$$b_2 = \sin\theta a_1 - \cos\theta a_1$$

(5) Given two affine maps $R_{\alpha,(a_1,a_2)}$ and $R_{\beta,(b_1,b_2)}$, prove that

$$R_{\beta,(b_1,b_2)} \circ R_{\alpha,(a_1,a_2)} = R_{\alpha+\beta,(t_1,t_2)}$$

for some (t_1, t_2), and find (t_1, t_2) in terms of β, (a_1, a_2) and (b_1, b_2).

Even in the case where $(a_1, a_2) = (0, 0)$, prove that in general

$$R_{\beta,(b_1,b_2)} \circ R_\alpha \neq R_\alpha \circ R_{\beta,(b_1,b_2)}.$$

Use (4)-(5) to show that the affine maps of the plane defined in this problem form a nonabelian group denoted $\mathbf{SE}(2)$.

Prove that $R_{\beta,(b_1,b_2)} \circ R_{\alpha,(a_1,a_2)}$ is not a translation (possibly the identity) iff $\alpha + \beta \neq k2\pi$, for all $k \in \mathbb{Z}$. Find its center of rotation when $(a_1, a_2) = (0, 0)$.

If $\alpha+\beta = k2\pi$, then $R_{\beta,(b_1,b_2)} \circ R_{\alpha,(a_1,a_2)}$ is a pure translation. Find the translation vector of $R_{\beta,(b_1,b_2)} \circ R_{\alpha,(a_1,a_2)}$.

Problem B5 (80 pts). A subset $\mathcal{A}$ of $\mathbb{R}^n$ is called an *affine subspace* if either $\mathcal{A} = \emptyset$, or there is some vector $a \in \mathbb{R}^n$ and some subspace U of $\mathbb{R}^n$ such that

$$\mathcal{A} = a + U = \{a + u \mid u \in U\}.$$

We define the dimension $\dim(\mathcal{A})$ of $\mathcal{A}$ as the dimension $\dim(U)$ of U.

(1) Because U is a subspace of $\mathbb{R}^n$, then $0 \in U$, we have $a + 0 \in \mathcal{A}$

What are affine subspaces of dimension 0? What are affine subspaces of dimension 1 (begin with $\mathbb{R}^2$)? What are affine subspaces of dimension 2 (begin with $\mathbb{R}^3$)?

Prove that any nonempty affine subspace is closed under affine combinations.

(2) At least from (1) we know $a \in \mathcal{A}$, $\mathcal{A}$ is not empty. For any $b \in \mathcal{A}$, we can find u, write as $b = a + u$. Then $b - a \in U$, $a + U = a + b - a + U = b + U$.

(3) Choose $x - a \in U_a$, $y - a \in U_a$, $\lambda, \mu \in \mathbb{R}$, then compute $\lambda(x-a) + \mu(y-a) = \frac{1}{\lambda+\mu}(\frac{\lambda}{\lambda+\mu}(x-a)+\frac{\mu}{\lambda+\mu}(y-a)) = \frac{\lambda}{\lambda+\mu}x+\frac{\mu}{\lambda+\mu}y-a$. Because $\mathcal{A}$ is closed under affine combinations, we have $\frac{\lambda}{\lambda+\mu}x + \frac{\mu}{\lambda+\mu}y \in \mathcal{A}$, then $\lambda(x-a)+\mu(y-a) = \frac{\lambda}{\lambda+\mu}(\frac{\lambda}{\lambda+\mu}x + \frac{\mu}{\lambda+\mu}y - a) \in \mathbb{R}^n$, U_a is a subspace of $\mathbb{R}^n$.
For any $u \in U_a$, we can write as $u = x - a = x + (b-a) - b$. The sum of coefficients of x, b, a is $1 - 1 + 1 = 1$, and $\mathcal{A}$ is closed under affine combinations, then $u = x + (b-a) - b \in \mathcal{A} - b \Rightarrow u \in U_b$. U_a does not depend on the choice of $a \in \mathcal{A}$, $U_a = U_b$ for all $a, b \in \mathcal{A}$. So $U_a = U = \{y - x \in \mathbb{R}^n \mid x, y \in \mathcal{A}\}$ and $\mathcal{A} = a + U, \quad$ for any $a \in \mathcal{A}$.

(4)If $\mathcal{A} \cap \mathcal{B} = (x)$, then we can find $x = a + u = b + v$ where $a \in \mathcal{A}, b \in \mathcal{B}$, $u, v \in U$. Write $b = a + u - v$, thus $b \in \mathcal{A} \Rightarrow \mathcal{A} = \mathcal{B}$, which is against $\mathcal{A} \neq \mathcal{B}$. We have $\mathcal{A} \cap \mathcal{B} = \emptyset$ if $\mathcal{A} \neq \mathcal{B}$ and $\mathcal{A}, \mathcal{B}$ are parallel.

Problem B6 (120 pts). (Affine frames and affine maps) For any vector $v = (v_1, \ldots, v_n) \in \mathbb{R}^n$, let $\widehat{v} \in \mathbb{R}^{n+1}$ be the vector $\widehat{v} = (v_1, \ldots, v_n, 1)$. Equivalently, $\widehat{v} = (\widehat{v}_1, \ldots, \widehat{v}_{n+1}) \in \mathbb{R}^{n+1}$ is the vector defined by

$$\widehat{v}_i = \begin{cases} v_i & \text{if } 1 \leq i \leq n, \\ 1 & \text{if } i = n+1. \end{cases}$$

(1) For any $m+1$ vectors $(u_0, u_1, \ldots, u_m)$ with $u_i \in \mathbb{R}^n$ and $m \leq n$, prove that if the m vectors $(u_1 - u_0, \ldots, u_m - u_0)$ are linearly independent, then the $m+1$ vectors $(\widehat{u}_0, \ldots, \widehat{u}_m)$ are linearly independent.

(2) Prove that if the $m+1$ vectors $(\widehat{u}_0, \ldots, \widehat{u}_m)$ are linearly independent, then for any choice of i, with $0 \leq i \leq m$, the m vectors $u_j - u_i$ for $j \in \{0, \ldots, m\}$ with $j - i \neq 0$ are linearly independent.

Any $m+1$ vectors $(u_0, u_1, \ldots, u_m)$ such that the $m+1$ vectors $(\widehat{u}_0, \ldots, \widehat{u}_m)$ are linearly independent are said to be *affinely independent*.

From (1) and (2), the vector $(u_0, u_1, \ldots, u_m)$ are affinely independent iff for any any choice of i, with $0 \le i \le m$, the m vectors $u_j - u_i$ for $j \in \{0, \ldots, m\}$ with $j - i \neq 0$ are linearly independent. If $m = n$, we say that $n + 1$ affinely independent vectors $(u_0, u_1, \ldots, u_n)$ form an *affine frame* of $\mathbb{R}^n$.

(3) if $(u_0, u_1, \ldots, u_n)$ is an affine frame of $\mathbb{R}^n$, then prove that for every vector $v \in \mathbb{R}^n$, there is a unique $(n+1)$-tuple $(\lambda_0, \lambda_1, \ldots, \lambda_n) \in \mathbb{R}^{n+1}$, with $\lambda_0 + \lambda_1 + \cdots + \lambda_n = 1$, such that

$$v = \lambda_0 u_0 + \lambda_1 u_1 + \cdots + \lambda_n u_n.$$

The scalars $(\lambda_0, \lambda_1, \ldots, \lambda_n)$ are called the *barycentric* (or *affine*) *coordinates* of v w.r.t. the affine frame $(u_0, u_1, \ldots, u_n)$.

If we write $e_i = u_i - u_0$, for $i = 1, \ldots, n$, then prove that we have

$$v = u_0 + \lambda_1 e_1 + \cdots + \lambda_n e_n,$$

and since $(e_1, \ldots, e_n)$ is a basis of $\mathbb{R}^n$ (by (1) & (2)), the n-tuple $(\lambda_1, \ldots, \lambda_n)$ consists of the standard coordinates of $v - u_0$ over the basis $(e_1, \ldots, e_n)$.

Conversely, for any vector $u_0 \in \mathbb{R}^n$ and for any basis $(e_1, \ldots, e_n)$ of $\mathbb{R}^n$, let $u_i = u_0 + e_i$ for $i = 1, \ldots, n$. Prove that $(u_0, u_1, \ldots, u_n)$ is an affine frame of $\mathbb{R}^n$, and for any $v \in \mathbb{R}^n$, if

$$v = u_0 + x_1 e_1 + \cdots + x_n e_n,$$

with $(x_1, \ldots, x_n) \in \mathbb{R}^n$ (unique), then

$$v = (1 - (x_1 + \cdots + x_x))u_0 + x_1 u_1 + \cdots + x_n u_n,$$

so that $(1 - (x_1 + \cdots + x_x)), x_1, \cdots, x_n)$, are the barycentric coordinates of v w.r.t. the affine frame $(u_0, u_1, \ldots, u_n)$.

The above shows that there is a one-to-one correspondence between affine frames $(u_0, \ldots, u_n)$ and pairs $(u_0, (e_1, \ldots, e_n))$, with $(e_1, \ldots, e_n)$ a basis. Given an affine frame $(u_0, \ldots, u_n)$, we obtain the basis $(e_1, \ldots, e_n)$ with $e_i = u_i - u_0$, for $i = 1, \ldots, n$; given the pair $(u_0, (e_1, \ldots, e_n))$ where $(e_1, \ldots, e_n)$ is a basis, we obtain the affine frame $(u_0, \ldots, u_n)$, with $u_i = u_0 + e_i$, for $i = 1, \ldots, n$. There is also a one-to-one correspondence between barycentric coordinates w.r.t. the affine frame $(u_0, \ldots, u_n)$ and standard coordinates w.r.t. the basis $(e_1, \ldots, e_n)$. The barycentric cordinates $(\lambda_0, \lambda_1, \ldots, \lambda_n)$ of v (with $\lambda_0 + \lambda_1 + \cdots + \lambda_n = 1$) yield the standard coordinates $(\lambda_1, \ldots, \lambda_n)$ of $v - u_0$; the standard coordinates $(x_1, \ldots, x_n)$ of $v - u_0$ yield the barycentric coordinates $(1 - (x_1 + \cdots + x_n), x_1, \ldots, x_n)$ of v.

(4) Let $(u_0, \ldots, u_n)$ be an affine frame $\in \mathbb{R}^n$, and $(v_0, \ldots, v_n) \in \mathbb{R}^m$. There is a unique affine map $f : \mathbb{R}^n \to \mathbb{R}^m$ such that $f(u_i) = v_i \ \forall i = 0, \ldots, n$.

Let $(u_0, \ldots, u_n)$ be a basis of $E \in \mathbb{R}^n$ and $(v_0, \ldots, v_n)$ be a basis for $F \in \mathbb{R}^m$. Let the affine map have the property that $f(u_i) = v_i \ \forall i = 0, \ldots, n$. Because we have affine frame, every vector $u \in \mathbb{R}^n$ can be written uniquely as $u_0\lambda_0 + u_1\lambda_1 + \ldots + u_n\lambda_n$ where $\sum_i \lambda_i = 1$.

We can write $f(u) = f(u_0\lambda_0 + u_1\lambda_1 + \ldots + u_n\lambda_n = lambda_0 f(u_0) + lambda_1 f(u_1) + \ldots + lambda_n f(u_n) = lambda_0 v_0 + lambda_1 v_1 + \ldots + lambda_n v_n$. So we can define a function $f : \mathbb{R}^n \to \mathbb{R}^m$ as above, such that $f(lambda_0 u_0 + lambda_1 u_1 + \ldots + lambda_n u_n) = lambda_0 v_0 + lambda_1 v_1 + \ldots + lambda_n v_n$. The function is unique, however we have to check if it is affine.

To check if it is affine, we first pic $w_1, \ldots, w_p \in \mathbb{R}^n$ and a set of $\mu_1 + \ldots + \mu_p = 1$. We can write linear combination of μ and w, such that, $f(\mu_1 w_1 + \ldots + \mu_p w_p) = \mu_1 f(w_1) + \ldots + \mu_p f(w_p)$. Now we can rewrite all the w's as the affine frame, such that,

$$w_1 = \sum_{i=0}^{n} \lambda_i \mu_i \ldots w_p = \sum_{i=0}^{n} \lambda_p \mu_p$$

Now we can expand and regroup in terms of the frame vectors.

(5) Let $(a_0, \ldots, a_n)$ be any affine frame in $\mathbb{R}^n$ and let $(b_0, \ldots, b_n)$ be any $n+1$ points in $\mathbb{R}^n$. Prove that the $(n+1) \times (n+1)$ matrix A corresponding to the unique affine map f such that

$$f(a_i) = b_i, \quad i = 0, \ldots, n,$$

is given by

$$A = \begin{pmatrix} \widehat{b}_0 & \widehat{b}_1 & \cdots & \widehat{b}_n \end{pmatrix} \begin{pmatrix} \widehat{a}_0 & \widehat{a}_1 & \cdots & \widehat{a}_n \end{pmatrix}^{-1}.$$

In the special case where $(a_0, \ldots, a_n)$ is the canonical affine frame with $a_i = e_{i+1}$ for $i = 0, \ldots, n-1$ and $a_n = (0, \ldots, 0)$ (where e_i is the ith canonical basis vector), show that

$$\begin{pmatrix} \widehat{a}_0 & \widehat{a}_1 & \cdots & \widehat{a}_n \end{pmatrix} = \begin{pmatrix} 1 & 0 & \cdots & 0 & 0 \\ 0 & 1 & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & 0 & 0 \\ 0 & 0 & \cdots & 1 & 0 \\ 1 & 1 & \cdots & 1 & 1 \end{pmatrix}$$

and

$$\begin{pmatrix} \widehat{a}_0 & \widehat{a}_1 & \cdots & \widehat{a}_n \end{pmatrix}^{-1} = \begin{pmatrix} 1 & 0 & \cdots & 0 & 0 \\ 0 & 1 & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & 0 & 0 \\ 0 & 0 & \cdots & 1 & 0 \\ -1 & -1 & \cdots & -1 & 1 \end{pmatrix}.$$

For example, when $n = 2$, if we write $b_i = (x_i, y_i)$, then we have

$$A = \begin{pmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -1 & -1 & 1 \end{pmatrix} = \begin{pmatrix} x_1 - x_3 & x_2 - x_3 & x_3 \\ y_1 - y_3 & y_2 - y_3 & y_3 \\ 0 & 0 & 1 \end{pmatrix}.$$

(6) Recall that a nonempty affine subspace $\mathcal{A}$ of $\mathbb{R}^n$ is any nonempty subset of $\mathbb{R}^n$ closed under affine combinations. For any affine map $f\colon \mathbb{R}^n \to \mathbb{R}^m$, for any affine subspace $\mathcal{A}$ of

$\mathbb{R}^n$, and any affine subspace $\mathcal{B}$ of $\mathbb{R}^m$, prove that $f(\mathcal{A})$ is an affine subspace of $\mathbb{R}^m$, and that $f^{-1}(\mathcal{B})$ is an affine subspace of $\mathbb{R}^n$.

Problem B7 (30 pts). Let A be any $n \times k$ matrix

(1) If choose $u \in ker(A),\ Au = 0$ then

$$\begin{aligned}
&\Rightarrow (A^\top A)u = A^\top(Au) = 0\\
&\Rightarrow u \in ker(A^\top A)\\
&\Rightarrow ker(A) \subseteq ker(A^\top A)
\end{aligned}$$

For the opposite, choose $v \in ker(A^\top A)$ then

$$\begin{aligned}
&\Rightarrow (A^\top A)u = A^\top(Au) = 0\\
&\Rightarrow Au \in ker(A^\top)
\end{aligned}$$

We need to prove $u \in ker(A)$, if not suppose $Au = x \neq 0$, then $(A^\top x)^\top = x^\top A = 0$, multiply u on both sides, we have $x^\top Au = x^\top x = 0 \Rightarrow x = 0$, which is against the assumption, thus $u \in ker(A) \Rightarrow ker(A^\top A) \subseteq ker(A)$. From $ker(A) \subseteq ker(A^\top A), ker(A^\top A) \subseteq ker(A)$, get $ker(A^\top A) = ker(A)$. From the equation $dim(ker(A)) + \text{rank}(A) = dim(E) = k$, we can easily find $\text{rank}(A^\top A) = \text{rank}(A) = k - dim(ker(A)) = k - dim(ker(A^\top A))$. We can use the same way to prove $ker(AA^\top) = ker(A^\top)$ and $\text{rank}(AA^\top) = \text{A}^\top$.

(2)From above, we know $\text{rank}(A^\top A) = \text{rank}(A)$. $\text{rank}(A) \leq min\{k, n\} = k$, because A has independent column vectors (a_i) $i = 1, 2, \cdots k$, then $\text{rank}(A) = k \Rightarrow \text{rank}(A^\top A) = k. A^\top A$ has full rank, it is invertible.
First we need to prove two things:

$$\begin{aligned}
(AB)^\top &= B^\top A^\top\\
(A^{-1})^\top &= (A^\top)^{-1}
\end{aligned}$$

Here is the simple proof:

$$\begin{aligned}
&(AB)^\top_{ij} = \sum_k a_{jk}b_{ki} = \sum_k b_{ki}a_{jk} = (B^\top A^\top)_{ij}\\
&(A^{-1})^\top A^\top = (AA^{-1})^\top = I\\
&\Rightarrow (A^{-1})^\top = (A^\top)^{-1}
\end{aligned}$$

Then

$$
\begin{aligned}
P^2 &= A(A^\top A)^{-1}A^\top \cdot A(A^\top A)^{-1}A^\top \\
&= A(A^\top A)^{-1}(A^\top A)(A^\top A)^{-1} \\
&= A(A^\top A)^{-1}A^\top \\
&= P \\
P^\top &= (A(A^\top A)^{-1}A^\top)^\top \\
&= A(A^\top A)^{-1})^\top A^\top \\
&= A((A^\top A)^\top)^{-1}A^\top \\
&= A(A^\top A)^{-1}A^\top \\
&= P
\end{aligned}
$$

When $k = 1$

What is the matrix P when $k = 1$?

(3) Prove that the image of P is the subspace V spanned by $a_1, \ldots, a_k$, or equivalently the set of all vectors in $\mathbb{R}^n$ of the form Ax, with $x \in \mathbb{R}^k$. Prove that the nullspace U of P is the set of vectors $u \in \mathbb{R}^n$ such that $A^\top u = 0$. Can you give a geometric interpretation of U?

Conclude that P is a projection of $\mathbb{R}^n$ onto the subspace V spanned by $a_1, \ldots, a_k$, and that

$$\mathbb{R}^n = U \oplus V.$$

Hint. You may use results from HW2.
